

- 1.1 All other sheets use final row heights. Check for functions already in use.
- 1.2 See photos for reorders Dashboard Quality Sections.
- 1.3 Ensure that the script for Section H processes, functions and testing is also removed.
- 1.4 Add Subheaders - header row – The subheader builder should insert/copy all three rows for each Monthly Change subsection. The third row must copy the governed header labels from the template header row and apply the 8pt header styling. The row should not be treated as a title row or placed in the dashboard title-row section.
- 1.5 Manual “Extra Notes”-- These are my corrections, clarifications or questions process them as such.

ANSWER the following.

“Why are Sections A and B grouped together in one function”

“Dashboard Quality Sections A-E updated-- Why is this running after all the data has been entered in each section”

“I believe this was removed. Old Framework Test 7”

“I think this is verified in Section F”

“Ran after this section was completed”

“Should only be verifying data from CP Due Date and Unlocked CP”

“When syncing CP Due Date and Unlocked CP Participant Name column ignore anything after LastName, FirstName like middle initials”

1.6 The format Raw Data added the title rows and additional columns to source sheet. Nothing should be done to the source sheet. Start with

1. Copy Template - Raw Data.
2. Rename copied template to Raw Data [mm.yy](#).
3. Read source data once.
4. Paste values in one bounded range.
5. Populate Primary PMR Row in memory before the output write if possible.
6. Delete source/import sheet.

2.2 Split Section A Global Inputs and Section B Title Rows verification written — 16.382 s into separate steps. Read Format Dashboard Once, Write Sections. The sections are already completely filled out when Dashboard Quality Sections A-E updated — 17.15 s runs . Is it a duplicate step?

2.3 Use the same functions as the Menu Hide Templates use.

2.4 Standardize using either Raw Data or Demo P as the base

2.5 Ensure Raw Data title/header row structure. And Normalize Raw Data headers and ensure Primary PMR Row. not needed the template containing all necessary columns and headers. Populate Raw Data approved sync column: Primary PMR Row. — should not be syncing from anywhere. Rows that have data in the “Date of Birth” column are “Primary PMR Row” - yes.

1. Prepare the source structure.
2. Read source data once.
3. Compute Primary PMR Row before paste.
4. Copy template once.
5. Paste one values block.
6. Delete source.
7. Avoid final row-height lock or scope it tightly. – Can try removing to see if the global default row height. The rows will stay at 25 and not expand with data.

2.6 YES both are required, combine them into one final prepared output array before writing to the copied template.

2.7 Framework Timing Report - See photo with updated Sections

3.1 The Sections of the Dashboard Quality and Format Dashboard are independent of each other.

3.3 These steps appear to be for running Format not Create Template

3.4 Subheaders should be owned by Monthly Change template construction, not Format Dashboard title rows. The setting can remain in Sheet Behaviors / template behavior configuration, but the rendered rows should be built by the Monthly Change subsection builder.

The builder should output:

Subsection title.

Dark spacer row.

Repeated 8pt header row copied from governed header definitions.

3.5 None of this is needed:

Convert to lowercase.

Trim spaces.

Normalize punctuation.

Need this:

Parse only the LastName, FirstName

Ignore middle initials, suffixes, or anything after a first name.

Only used when syncing CP Due and Unlocked CP. Participant Name on CP Due contains middle initial and Unlocked CP does not.

3.6 Make sure all steps or processes are being logged. There is a long lag time at the end of processes and Framework Timing Report does not match Google Apps Scripts Executions

Priority 1 — Fix runtime failures before tuning

Fix applyFinalRowHeightLock_ is not defined in Create Disenrolled List.

— All other sheets use final row heights. Check for functions already in use.

Priority 2 — Correct Dashboard Quality execution order

Priority 3 — Clean report annotations out of generated reports

Remove manual review comments from generated Dashboard Quality / Framework Timing sheets. — will add notes when necessary. Add an additional column if necessary.

Priority 4 — Fix Monthly Change subheaders

Keep the Subheaders: ON behavior as configuration only

Agree with recommendation

Priority 5 — Optimize Raw Data format path

DO NOT add anything to the source sheet

1. Copy Template - Raw Data.
2. Rename copied template to Raw Data [mm.yy](#).
3. Read source data once.
4. Paste values in one bounded range.
5. Populate Primary PMR Row in memory before the output write if possible.
6. Delete source/import sheet.

Priority 5 — Optimize Raw Data format path

Add title rows to imported Raw Data sheet before formatting. — DO NOT IT IS INCLUDED IN THE TEMPLATE

1. Prepare the source structure.
2. Read source data once.
3. Compute Primary PMR Row before paste.
4. Copy template once.
5. Paste one values block.
6. Delete source.
7. Avoid final row-height lock or scope it tightly. – Can try removing to see if the global default row height. The rows will stay at 25 and not expand with data.

Priority 6 — Batch template hiding

Use existing Hide Templates function

Priority 7 — Standardize template/output processing– Timing Log of fastest full template build

Complete full template build: Template - Banner Report	14.058
Complete full template build: Template - Demo P	14.301
Complete full template build: Template - Unlocked Care Plan	15.811
Complete full template build: Template - Raw Data	22.289
Complete full template build: Template - Care Plan Due	22.775
Complete full template build: Template - Master List	24.117
Complete full template build: Template - Monthly Change	24.607
Complete full template build: Template - Disenrolled Exclusion	30.431
Complete full template build: Template - Master List Change Log	33.052

Priority 8 — Add Total Seconds to Framework Timing Section C

Add Total Seconds column.

AGREE

Priority 9 — Normalize Care Plan sync participant names

Add a participant-name normalization helper for CP sync.

None of this is needed:

- Convert to lowercase.

- Trim spaces.

- Normalize punctuation.

Need this:

- Parse only the LastName, FirstName

- Ignore middle initials, suffixes, or anything after a first name.

- Only used when syncing CP Due and Unlocked CP. Participant Name on CP Due contains middle initial and Unlocked CP does not.

When sync CP Due match using Participant Name and Enrollment Date.

- Enrollment Date = Capitation Date
