

Gemini Review Prompt

You are reviewing Google Apps Script code for the Master List Framework.

Goal:

Review the attached script files for efficacy, correctness, runtime speed, Apps Script quota safety, and architecture compliance. Focus on whether the code will run efficiently and correctly in Google Sheets production use.

Files to review:

v1.5.54 - Dashboard Quality Report.pdf

v1.5.54 - Framework Timing Report.pdf

v1.5.54 - Google Apps Scripts Executions.pdf

Gemini Test - Dashboard Quality, Framework Timing, System Tools, and QA

Gemini Test - Format Dashboard and Create Templates

Gemini Test - Format Banners, CP Due Date, Unlock Care Plan, and Raw Data

v1.5.54_Production_Script — Full complete script

Context:

This is a Google Apps Script framework for a Master List / Report Formatter workflow. It processes Raw Data, Demo P, Master List, Banners, Care Plan Due, Unlocked Care Plan, Disenrolled Exclusion, Monthly Change reports, Format Dashboard templates, Dashboard Quality Report, and Framework Timing Report.

Architecture rules:

- Preserve single-file production architecture.
- Dashboard owns formatting, templates, headers, columns, row heights, hidden columns, and template behavior.
- Business workflows should not directly own report formatting.
- Runtime formatting should be minimized or no-op unless writing dashboard/system reports or applying dashboard/template-controlled formatting.
- Dashboard Quality Report should update sections only, not rebuild/delete/recreate the whole report unnecessarily.
- Framework Timing should measure major workflows and report bottlenecks without timing every small helper.
- Avoid modifying PDF/report/binary artifacts.

- Do not recommend modular production architecture unless clearly separated as test/reference scripts only.
- The current production version must remain v1.5.54.

Primary review objectives:

1. Efficacy / Correctness

- Identify bugs, broken references, missing helper functions, duplicate functions, unreachable code, inconsistent naming, bad constants, bad sheet names, bad section mappings, or incorrect data mappings.
- Verify Care Plan Due and Unlocked Care Plan sync logic is safe and aligned with the Master List workflow month.
- Verify Raw Data → Demo P → Master List flow preserves Primary PMR governance.
- Verify Disenrolled Exclusion, Monthly Change, Banners, CP Due, and Unlocked CP outputs use the correct template/dashboard-controlled output paths.
- Verify Last Name / First Name handling is consistent where applicable.
- Verify report title/version output uses v1.5.54 consistently.

2. Speed / Performance

- Find Apps Script bottlenecks such as excessive ``getRange``, ``setValue``, ``setValues``, ``setBackground``, ``setFont``, ``hideRows``, ``hideColumns``, ``deleteRows``, ``insertRows``, ``autoResize``, ``flush``, or SpreadsheetApp calls inside loops.
- Identify full-sheet reads/writes that can be narrowed.
- Identify repeated dashboard/template loads that should be cached.
- Identify template rebuilds that should be metadata-only refreshes or signature-skips.
- Identify repeated styling passes that should be batched or removed.
- Identify section report writes that could be batched.
- Flag anything likely to exceed Google Apps Script execution time limits or quotas.

3. Architecture Compliance

- Confirm formatting authority remains with Format Dashboard/templates.
- Flag any business workflow function that directly applies formatting instead of using dashboard/template-controlled paths.
- Confirm template creation does not hide templates after every individual build if that causes performance/visibility issues.
- Confirm Dashboard Quality sections use the correct current section mapping and update the correct sections.
- Confirm Framework Timing sections and Dashboard Quality sections are not duplicated, stale, or misrouted.
- Confirm test/artifact rows that were removed/retired do not still appear in Signoff/Summary.

4. QA / Diagnostics

- Review Dashboard Quality Report functions for correct section routing, row widths, section persistence, signoff, summary, and status calculation.
- Review Framework Timing functions for useful benchmark thresholds, severity assignment, summary generation, and recommendations.
- Verify QA/test functions do not mutate production data unexpectedly.
- Identify any QA functions that are too slow or too broad.

5. Split Test Scripts

- Review the three `Gemini Test - ...` scripts as extracted review/test bundles.
- Confirm whether each split file contains the intended category of functions:
 - A. Dashboard Quality Report, Framework Timing, System tools, and QA.
 - B. Format Dashboard and Create Templates.
 - C. Format Banners, CP Due Date, Unlocked Care Plan, and Raw Data.
- Identify missing critical dependencies in the split scripts if they are intended to run independently.
- If they are only reference/review bundles, say whether their scope labels are accurate.

Important constraints:

- Do not rewrite the whole framework.
- Do not recommend changing the production script version away from v1.5.54.
- Do not recommend changes to PDF/report/binary files.
- Prefer targeted, low-risk fixes.
- Preserve existing business logic unless a clear bug is found.
- Prioritize speed improvements that reduce SpreadsheetApp calls, repeated formatting, repeated template rebuilds, or broad sheet mutations.

Deliverable format:

Return a structured review with these sections:

1. Executive Summary

- Overall readiness: Ready / Needs minor fixes / Needs major fixes / Not ready.
- Top 5 risks.
- Top 5 speed opportunities.

2. Critical Issues

For each issue:

- Severity: Critical / High / Medium / Low.
- File.
- Function name.
- Approximate line or searchable code phrase.
- Problem.
- Impact.
- Recommended targeted fix.
- Whether fix is required before production.

3. Performance Bottlenecks

For each bottleneck:

- Function name.
- Slow pattern.
- Why it is slow in Apps Script.
- Estimated risk: execution timeout / quota pressure / user delay / unnecessary rebuild.
- Recommended optimization.

4. Architecture Issues

For each issue:

- Which architecture rule it violates.
- Where it occurs.
- Recommended repair.

5. Dashboard Quality / Framework Timing Review

- Confirm section mapping.
- Confirm section-only update behavior.
- Identify stale/retired tests or artifacts still appearing in summary/signoff.
- Identify any report rebuild or styling bottlenecks.

6. Workflow Sync Review

Specifically review:

- CP Due Date sync.
- Unlocked Care Plan sync.
- Raw Data → Demo P.
- Demo P → Master List.

- Monthly Change.
- Disenrolled Exclusion.
- Banners.

For each, say:

- Pass / Concern / Fail.
- Evidence.
- Recommended fix if needed.

7. Split Script Review

For each Gemini Test script:

- Does it contain the intended function category?
- Is it runnable independently?
- Missing dependencies, if any.
- Recommended use: runnable test script / reference bundle / needs dependency bundle.

8. Prioritized Remediation Plan

Use this priority order:

- P0: must fix before production.
- P1: should fix before broad use.
- P2: performance/maintainability improvements.
- P3: optional cleanup.

9. Suggested Patch Plan

- List exact minimal code edits recommended.
- Do not provide a full rewritten file unless asked.
- Keep fixes targeted.

10. Final Verdict

- Is v1.5.54 safe to test?
- Is v1.5.54 safe for production?
- What must be validated in a staging spreadsheet before release?

Optional add-on if you want Gemini to be stricter:

Be skeptical and specific. Do not give generic advice. Every issue must reference a function name or searchable phrase from the code. If you cannot prove an issue from the script, mark it as "needs runtime verification" instead of asserting it as fact.
