

Dashboard Architecture Specification

Purpose

The Format Dashboard is the single source of truth for framework configuration.

The dashboard controls:

- System Sheet generation
- Template generation
- Template formatting
- Dashboard Quality validation
- Framework Timing validation
- Sheet behavior configuration
- Column configuration
- Header configuration

The framework shall be dashboard-driven.

Templates shall not contain hardcoded configuration values when a dashboard definition exists.

The Dashboard governs formatting.

The framework governs processing.

Dashboard Architecture Principles

Dashboard Driven Architecture

All framework-controlled formatting shall originate from dashboard definitions.

Examples:

- Header definitions
- Column widths
- Column visibility
- Alignment
- Number formats
- Date formats

- Sheet behavior settings
 - Template definitions
-

Single Source of Truth

The dashboard shall be the authoritative source for:

- Sheet definitions
- Header definitions
- Column definitions
- Sheet behavior definitions

Template sheets shall be generated from dashboard configuration.

Template First Formatting

Formatting shall be applied to templates.

Output sheets inherit formatting from templates.

Processing functions shall not perform runtime formatting except where specifically governed.

Dashboard Sheet Name

Required Sheet:

None

Format Dashboard

This sheet shall always exist.

Dashboard Sections

The Format Dashboard contains five governed sections.

SECTION A - Global Inputs

Purpose:

Store framework-wide configuration values.

Required Columns:

Settings	Values	Notes
----------	--------	-------

Examples:

- Framework Version
- Header Row
- Data Start Row
- Default Date Format
- Default Font
- Default Font Size
- Freeze Rows
- Freeze Columns

Dashboard Quality Section A validates this section.

SECTION B - Sheet Definitions

Purpose:

Define every governed framework sheet.

Required Columns:

| Sheet Type | Sheet Name | Template Name | Active | Notes |

Examples:

- Dashboard Quality Report
- Framework Timing Report
- Monthly Change Report
- Master List
- Care Plan Due Report
- Unlocked Care Plan Report
- Banner Report

Dashboard Quality Section B validates this section.

SECTION C - Header Definitions

Purpose:

Define all governed headers.

Required Columns:

| Sheet Type | Header Name | Display Order | Required | Notes |

Rules:

- Headers are dashboard controlled.
- Templates build from these definitions.
- Runtime processing shall not add or remove columns.

Dashboard Quality Section C validates this section.

SECTION D - Column Definitions

Purpose:

Define formatting and behavior for every governed column.

Required Columns:

| Header Name | Width | Alignment | Wrap | Number Format | Hidden | Notes |

Examples:

Width:

None

120

150

200

Alignment:

None

Left

Center

Right

Number Format:

None

General

Text

mm/dd/yyyy

Dashboard Quality Section D validates this section.

SECTION E - Sheet Behavior Definitions

Purpose:

Define sheet-level behavior.

Required Columns:

| Sheet Type | Property | Value | Notes |

Examples:

Properties:

- Frozen Rows
- Frozen Columns
- Filter Enabled
- Alternating Colors
- Uses Title Rows
- Uses Subheaders
- Hidden Template
- Group Rows

Dashboard Quality Section E validates this section.

Dashboard Ownership

The Dashboard owns:

- Sheet definitions
- Header definitions
- Column definitions
- Sheet behavior definitions
- Template configuration

The Dashboard does not own:

- Business processing
 - PMR logic
 - Contact processing
 - Care Plan synchronization logic
-

Dashboard Rebuild Rules

Rebuild Format Dashboard Defaults shall:

- Create Format Dashboard if missing
- Create Sections A-E if missing

- Create required headers
 - Create required formatting
 - Not overwrite user-entered configuration values unless explicitly requested
-

Dashboard Quality Relationship

Dashboard Quality validates dashboard configuration.

Dashboard Quality shall not modify dashboard configuration.

Validation only.

Section ownership:

- A - Global Inputs Verification
 - B - Sheet Definitions Verification
 - C - Sheet Headers Verification
 - D - Column Definitions Verification
 - E - Sheet Behavior Verification
-

Template Relationship

Templates are generated from dashboard definitions.

Templates shall inherit:

- Headers
- Column widths
- Alignment
- Number formats
- Visibility settings
- Sheet behavior

Templates shall not become the source of truth.

The dashboard remains authoritative.

Governance

The Format Dashboard is the authoritative configuration source for framework formatting architecture.

Any conflict between template formatting and dashboard definitions shall be resolved in favor of dashboard definitions.
