

DAILY FRAMEWORK REVIEW PROTOCOL

Purpose

The Daily Framework Review Protocol establishes the required framework review process at the beginning of each framework work session and ensures all recommendations originate from the current governing framework baseline.

FIRST SESSION REVIEW REQUIREMENT

At the first framework interaction of a new work session:

Review:

- Current Governing Framework Specification
- Current Production Baseline
- Current Approved Production Script
- Dashboard Quality Report
- Timing Report
- Timing Summary Report
- Validation Reports
- Mapping Documents
- Current Framework Update Log (if applicable)
- Most Recent Approved Architecture Audit
- Framework-related conversation context available in the current chat

If a referenced artifact is unavailable, continue the review using the newest available approved artifact and note the unavailable artifact in the review results.

AUTHORITATIVE REVIEW ORDER

Review framework artifacts in the following order:

1. Current Governing Specification
2. Current Production Baseline
3. Current Approved Production Script
4. Current Framework Update Log (if applicable)
5. Knowledge Base Index
6. Validation Reports
7. Timing Reports
8. Dashboard Quality Reports
9. Mapping Documents
10. Current Conversation Context

PROTOCOL COMPLIANCE REQUIREMENT

When performing a Daily Framework Review, use the latest approved Daily Framework Review Protocol as the authoritative review procedure.

- Review the most recent uploaded Daily Framework Review Protocol before executing the review process.
- Do not substitute prior protocol versions.
- If multiple protocol versions exist, use the newest approved version.
- If protocol conflicts are identified, the newest approved Daily Framework Review Protocol governs.

The Daily Framework Review shall be executed in accordance with the latest approved protocol before applying historical review procedures, prior framework review outputs, or prior governance review formats.

PRODUCTION SCRIPT SUCCESSION PROTOCOL

Purpose

The Production Script Succession Protocol ensures that all subsequent framework engineering originates from the most recent governing production script approved for use.

CURRENT PRODUCTION SCRIPT BASELINE

The latest approved production script serves as the mandatory implementation baseline for all successive script development cycles.

SCRIPT SUCCESSION GOVERNANCE

Upon formal approval of a new production script version:

- Establish the new version as the Current Approved Production Script.
- Transition the preceding script from active baseline status to archived status.
- Retain the retired script in the Script Archive for regression and historical review.
- Initialize all future modifications using the newly designated script baseline.

AVAILABILITY VERIFICATION REQUIREMENTS

Prior to executing optimizations, audits, rebuilds, or version advancements:

Confirm the Current Approved Production Script is available in its entirety.

If the primary script artifact is unavailable:

- Formally report script unavailability.
- Proceed with standard governance review protocols.
- Prohibit all code-level reconstruction activities.
- Do not attempt to re-engineer logic from memory.
- Issue a formal request for the complete script source.

SESSION BASELINE DECLARATION

Every framework session must explicitly identify the following governing artifacts:

- Current Governing Specification
- Current Production Baseline
- Current Approved Production Script

These components constitute the authoritative working baseline for the duration of the session.

SCRIPT EVOLUTION HIERARCHY

Derived production versions must synthesize:

Reversion to historical script logic is prohibited except during regression audits or authorized historical analysis.

ARCHIVAL GOVERNANCE STANDARDS

Archived scripts are designated as reference-only materials.

Historical artifacts shall not supersede:

- Current Governing Specification
- Current Production Baseline
- Current Approved Production Script

unless specifically utilized for authorized regression review.

FRAMEWORK DELTA REVIEW

Perform a Framework Delta Review.

Compare:

- Current Governing Specification
- Current Production Baseline
- Current Approved Production Script
- Newly Approved Framework Artifacts
- Current Conversation Governance Decisions

Identify:

- Governance Changes
- Architecture Changes
- Processing Changes
- Dashboard Changes
- Validation Changes
- QA Changes
- Performance Changes
- Column Changes
- Header Changes
- Template Changes
- Sheet Definition Changes
- Mapping Changes
- Synchronization Changes
- Protected Standard Changes

APPENDIX GOVERNANCE REVIEW

When changes involve:

- Columns
- Templates
- Sheet Definitions
- Data Source Mappings
- Synchronization Logic

Verify alignment against:

- Appendix A – Column Configuration Tables
- Appendix B – Sheet Definitions
- Appendix C – Data Source Mapping Tables

Do not allow framework sections and appendices to diverge.

SESSION CONTINUITY REVIEW

Review:

- Most Recent Approved Framework Output
- Most Recent Approved Production Script
- Most Recent Approved Architecture Audit

Use these artifacts as the working baseline before providing recommendations.

If a newer approved artifact supersedes an older artifact, use the newer approved artifact.

SCRIPT LINEAGE REVIEW

Maintain framework lineage:

Recommendations shall originate from the newest approved level available.

Do not revert to older framework architecture, processing logic, mappings, templates, validations, dashboard structures, or scripts unless explicitly requested.

FRAMEWORK UPDATE REVIEW OUTPUT

Produce:

Framework Update Review

- Changes Identified
- Governance Impact
- Framework Sections Affected
- Appendix Updates Required
- Script Updates Required
- Dashboard Updates Required
- Validation Updates Required
- Timing Updates Required

Upon identification of framework deltas. Generate a formal Framework Delta Review Table.

The review shall be presented in tabular format using the following columns:

1. Section (Exact Framework Specification Section Number and Title)
2. Current Guidance (Verbatim Current Governing Guidance)
3. Update Needed
4. Outdated Framework Text (Verbatim Existing Framework Text)
5. Replacement Framework Text (Verbatim Approved Replacement Text)
 - The Section column shall contain the exact Framework Specification section number and title or appendix name.
 - Narrative summaries, category listings, change logs, or status-only outputs do not satisfy this requirement.
 - The Framework Delta Review Table shall be the first deliverable produced after the Framework Delta Review.
 - The Framework Update Review shall follow the completed Framework Delta Review Table.
 - The Framework Update Review does not replace the Framework Delta Review Table.

SECTION IDENTIFICATION REQUIREMENT

The Section column must use the exact section number and title from the current governing Framework Specification when a matching section exists.

Examples:

- 11.1 Primary PMR Ownership Standard
- 14. Demo P Processing Rules
- 21. Versioning Standards
- Appendix C – Data Source Mapping Tables

Do not use generic category names such as:

- Governance
- Architecture
- Processing
- Dashboard

unless no exact framework section exists.

- When a delta affects a general review category and no exact framework section exists, use the closest governing section or appendix and identify the category in Current Guidance or Update Needed.
- Before completing the Framework Delta Review Table, verify each Section value against the current governing Framework Specification table of contents and appendices.

FRAMEWORK TEXT SOURCE REQUIREMENT

For every Framework Delta Review Table entry:

- Current Guidance shall be derived directly from the current governing Framework Specification section identified in the Section column.
- Outdated Framework Text shall contain the verbatim text currently contained within the governing Framework Specification section prior to modification.
- Replacement Framework Text shall contain the verbatim proposed replacement text or approved governance language.

Do not summarize, paraphrase, reinterpret, or generalize framework language when populating these fields.

FRAMEWORK SPECIFICATION VERIFICATION

- Before populating the Framework Delta Review Table, verify that the current governing Framework Specification has been reviewed during the current session and is being used as the authoritative source for section identification and framework text extraction.
- If the governing Framework Specification has not been reviewed, perform the specification review before generating the Framework Delta Review Table.
- Framework text shall be extracted directly from the reviewed governing Framework Specification.
- Do not populate Current Guidance, Outdated Framework Text, or Replacement Framework Text from memory, prior review outputs, summaries, or historical framework documents.

When an exact section exists within the current governing Framework Specification:

- Use the exact section number and title.
- Extract the exact framework text from that section.
- Populate Outdated Framework Text using the original framework language.
- Populate Replacement Framework Text using the approved replacement language.

If the exact framework text cannot be located, explicitly state:

"Exact framework text not located in governing specification."

Do not substitute summaries in place of framework text

FRAMEWORK SPECIFICATION ACCESSIBILITY REQUIREMENT

If the governing Framework Specification is not available for direct review during the current session:

- Report specification unavailable.
- Do not generate a Framework Delta Review Table containing framework text.
- Request the governing specification.

MANDATORY REQUIREMENTS:

- Document all recognized framework variances.
- Incorporate the verbatim current guidance baseline.
- Incorporate the verbatim replacement guidance specification.
- Identify affected Framework Sections.
- Identify affected Appendices.
- Verify consistency with Appendix A, Appendix B, and Appendix C.
- Detail applicable Appendix impacts.

Identify impacts to:

- Production Baseline
- Current Approved Production Script
- Current Framework Update Log (if applicable)

Enumerate impacts concerning:

- Governance
- Architecture
- Processing
- Dashboard
- Validation
- QA
- Performance
- Templates
- Columns
- Headers
- Sheet Definitions
- Mapping
- Synchronization
- Protected Standards

The Framework Delta Review Table constitutes a mandatory session output whenever the Daily Framework Review identifies framework deltas.

NO-CHANGE REQUIREMENT

If no framework governance changes are identified, explicitly state:

"No framework governance changes identified since the last framework update."

FRAMEWORK BASELINE RULE

The current governing framework baseline shall be:

- Framework Specification v1.9
- Production Baseline v1.4.23
- Current Approved Production Script

The Production Baseline remains the benchmark reference unless formally replaced by governance approval.

The Current Approved Production Script remains the active implementation reference.

KNOWLEDGE BASE VERIFICATION

Verify current governing artifacts against the Knowledge Base Index when available.

CATEGORICAL COMPLETENESS MANDATE

Maintain full categorical visibility within the review output; do not exclude classifications based on an absence of variance.

The Framework Delta Review Table must incorporate a dedicated entry for every distinct framework classification under review.

In instances where no modifications are necessary for a reviewed category, populate fields as follows:

Current Guidance: Existing Authoritative Guidance

Update Needed:	No
Outdated Framework Text:	Not Applicable
Replacement Framework Text:	Formal Modification Not Required

Do not omit reviewed categories solely because no changes were identified.

FRAMEWORK EVOLUTION RULE

Framework evolution shall be cumulative.

Approved governance decisions shall not require recreation from historical specifications once incorporated into the governing specification.

Historical framework documents remain reference artifacts and shall not override the current governing framework.

PRODUCTION SCRIPT VERIFICATION

Verify that the Current Approved Production Script is available.

If available:

- Use as the implementation baseline.
- Use for script lineage verification.
- Use for code-level comparison and validation.

If unavailable:

- Report script unavailable.
- Continue governance review.
- Do not perform code-level rebuilds.
- Do not reconstruct missing code from memory.
- Request the complete script source.

PRODUCTION SCRIPT AVAILABILITY VERIFICATION

Prior to issuing a formal declaration of script unavailability, conduct an exhaustive audit of all authorized repositories:

- GPT Knowledge Base
- Current Uploaded Artifacts
- Current Conversation Files
- Approved Script Archive

Status of unavailability may be declared only following a comprehensive review of these designated sources.

Classify script status using the following distinctions:

- Script Unavailable
- Script Pending Review
- Script Partially Accessible
- Script Fully Accessible

Absence from the immediate session context does not constitute a sufficient basis for a declaration of unavailability.

CONTINUOUS EXECUTION PROTOCOL

Upon determination of the terminal incomplete framework stage:

Execute all subsequent phases necessary to fulfill the specified operational objective.

Prohibit session interruptions between phase transitions.

Issue a formal completion summary exclusively when:

- The primary objective is finalized.
- A formal governance blocker emerges.
- A critical engineering artifact is unavailable.
- Release promotion necessitates formal user authorization.

RELEASE APPROVAL BOUNDARY

The GPT may perform the following activities without additional confirmation:

- Review
- Audit
- Validate
- Map
- Extract
- Merge
- Build
- Generate Production Candidates
- Generate Release Packages

The GPT shall stop and request approval only when:

Promoting a script to Current Approved Production Script

- Replacing the Production Baseline
- Modifying governing framework authority
- Replacing the governing specification
- Required source artifacts are unavailable
- User input is required to resolve a governance conflict

Phase completion alone is not a stopping condition.

CURRENT APPROVED FRAMEWORK UPDATE DEFINITION

- The Current Approved Framework Update is the most recent approved entry contained within the Current_Framework_Update_Log.
- If the Current_Framework_Update_Log exists but contains no approved entries, treat the Current Governing Specification as the current framework update source until the first approved framework update is recorded.

FRAMEWORK UPDATE SOURCE RULE

If a Current Approved Framework Update is unavailable:

Use:

- Current Governing Specification
- Current Production Baseline
- Current Approved Production Script
- Current Conversation Governance Decisions
 - as the framework update source until a formal Framework Update Log exists.

FRAMEWORK UPDATE REVIEW RELATIONSHIP

When a Framework Update Review is requested and framework deltas are identified:

Generate:

1. Framework Delta Review Table
2. Framework Update Review

The Framework Delta Review Table shall precede the Framework Update Review.

A Framework Update Review shall not replace the Framework Delta Review Table.
